H. PYLORI CHEK™

An Enzyme Immunoassay for the Qualitative Detection of Helicobacter pylori Specific Antigen in Human Fecal Specimens

Catalog No. T5051 (96 Tests)

IVD In Vitro Diagnostic Medical Device

Made in the USA

® TECHLAB, Inc.
2001 Kraft Drive
Blacksburg, VA 24060-6358, USA

INTENDED USE
The TECHLAB® H. PYLORI CHEK™ test is an enzyme immunoassay for the qualitative detection of Helicobacter pylori specific antigen. It is intended for use with human fecal specimens to aid in the diagnosis of H. pylori infection and to demonstrate loss of H. pylori antigen following treatment. The test can be used with unpreserved fecal specimens and fecal specimens preserved in transport media from patients suspected of H. pylori infection. Testing of patients to demonstrate loss of H. pylori antigen following treatment should be performed no sooner than 4 weeks after completion of the treatment regimen. Test results should be taken into consideration by the physician in conjunction with the patient history and symptoms.

Caution: U.S. Federal Law restricts this device to sale by or on the order of a physician.

EXPLANATION
It is estimated that half of the global population is infected with H. pylori.1 The majority of those infected remain asymptomatic and do not require treatment (colonized individuals). A minority of infected individuals develop gastritis, and a fraction of those further develop gastric ulcers or gastric cancer.2 The diagnosis of H. pylori infection is endoscopy with biopsy – the biopsied tissue is tested for the presence of H. pylori by culture, histology, or rapid urease test. Under current guidelines, endoscopy is still recommended for the diagnosis of H. pylori infection in patients with alarm symptoms (e.g. GI bleeding, sudden weight loss, excessive vomiting, anemia), or patients over the age of 55. However, for younger patients not exhibiting alarm symptoms, non-invasive tests such as the urea breath test (UBT) or fecal antigen test are recommended for diagnosis of H. pylori infection.3,4 Following completion of a treatment regimen of antibiotics and a proton pump inhibitor (PPI), it is recommended that patients be tested to verify eradication of H. pylori infection.5 Serum antibody tests are also available, but these are unable to distinguish between past and current infection. By detecting antigen present in fecal specimens, the H. PYLORI CHEK™ test allows for the non-invasive detection of H. pylori when endoscopy is not required.

PRINCIPLE OF THE TEST
The H. PYLORI CHEK™ test uses antibodies specific to H. pylori antigen. The Microassay Plate in the kit contains immobilized capture antibodies against H. pylori antigen. The Conjugate consists of antibodies specific to H. pylori antigen conjugated to horseradish peroxidase. In the assay, an aliquot of a diluted fecal specimen is transferred to a microassay well containing the Conjugate. If the antigen is present in the specimen, it will bind to the Conjugate and to the immobilized capture antibody during the incubation phase. Any unbound material is removed during the washing steps. Following the addition of Substrate, a color is detected due to the enzyme-antibody-antigen complexes that formed in the presence of antigen.

MATERIALS PROVIDED

| MA | PLT | Microassay Plate | 12 strips, each consisting of 8 wells coated with antibodies to H. pylori antigen (stored with desiccant) |
| CONJ | IMM | Conjugate (7 mL) | Antibodies to H. pylori antigen coupled to horseradish peroxidase in a buffered protein solution containing 0.05% ProClin® 300 |
| DIL | SPE | Diluent (40 mL) | Buffered protein solution. The Diluent is also to be used as the negative control solution (see TEST PROCEDURE) containing 0.05% ProClin® 300. |

PROZONE
To ensure that a high concentration of H. pylori antigen does not interfere with a positive reaction in the H. PYLORI CHEK™ test, high positive samples were prepared by spiking a negative fecal pool at concentrations up to 10 times the highest concentration of antigen observed in a positive clinical specimen. A total of 5 different dilutions of H. pylori antigen was prepared and tested in triplicate. The results demonstrated that there was no overall prozone effect, that elevated levels of antigen did not affect the detection of the antigen.

INCLUSIVITY STUDY
The following strains, which include isolates representing described H. pylori populations, were tested for reactivity with the H. PYLORI CHEK™ test. All strains tested generated a positive result.

ATCC 700392  JP26
ATCC 43526  ATCC 43504
ATCC 700824  ATCC 43579

INTERFERING SUBSTANCES (U.S. FORMULATION)
The following substances had no effect on positive or negative H. PYLORI QUIK CHEK™ test results analyzed at the concentrations indicated:
Barium sulfate (5% w/v), Benzalkonium Chloride (1% w/v), Ciprofloxacin (0.25% w/v), Ethanol (1% w/v), Hog gastric mucin (3.5% w/v), Human blood (40% v/v), Hydrocortisone (1% w/v), Imodium® (5% v/v), Kapectate® (5% v/v), Leukocytes (0.05% v/v), Maalox® Advanced (5% v/v), Mesaralazine (10% w/v), Metronidazole (0.25% w/v), MiraLax® (7% w/v), Mineral Oil (10% w/v), Mylanta® (4.2 mg/mL), Naproxen Sodium (5% w/v), Nonoxynol-9 (1% w/v), Nystatin (1% w/v), Palmitic Acid/Fecal Fat (40% w/v), Pepto-Bismol® (5% v/v), Phenylephrine (1% w/v), Prilosec OTC® (5 µg/mL), Sennosides (1% w/v), Simethicone (10% w/v), Stearic Acid/Fecal Fat (40% w/v), Tagamet® (5 µg/mL), TUMS® (50 µg/mL), Human Urine (5% v/v), and Vancomycin (0.25% w/v).

ANALYTICAL SENSITIVITY
The Limit of Detection (LoD) for the H. PYLORI CHEK™ test was established at 6.70 ng/mL in fecal matrix (0.13 ng/test) for Helicobacter pylori antigen using cell lysate antigen prepared from H. pylori strain ATCC 43526. For specimens in Cary Blair media, the LoD was established at 26.57 ng/mL (0.33 ng/test). For specimens in C&S media, the LoD was established at 18.19 ng/mL (0.23 ng/test).

PRECISION – INTRA-ASSAY
For the determination of intra-assay performance, 8 fecal samples were analyzed by the H. PYLORI CHEK™ test. The samples included 2 negative, 2 high negative, 2 low positive, and 2 moderate positive samples. Each specimen was assayed a total of five times using two different kit lots. Positive specimens tested as expected and negative specimens consistently tested negative.

PRECISION – INTER-ASSAY
For the determination of inter-assay performance, 8 fecal samples were analyzed by the H. PYLORI CHEK™ test. The samples included 2 negative, 2 high negative, 2 low positive, and 2 moderate positive samples. The samples were tested twice a day by multiple technicians over a 12-day period using 2 different kit lots. The positive samples tested as expected 98.3% of the time and the negatives tested as expected 97.8% of the time.

FRESH VERSUS FROZEN SAMPLES
The effect of long term frozen specimen storage on antigen stability was evaluated. For the analysis, a total of 32 fecal specimens was tested with the H. PYLORI CHEK™ test. The fecal specimens consisted of 2 negative fecal samples, 5 high negative fecal samples, 10 low positive fecal samples, and 15 positive fecal samples covering the range of the test (50 ng/mL – 1200 ng/mL). Samples were prepared and stored ≤ -10°C and ≤ -70°C and tested at 0, 5, 10, and 14 days. No conversion of positive-to-negative or negative-to-positive was observed in any of the samples at the specified time points.

THE LIMIT OF DETECTION (LOD) FOR THE H. PYLORI CHEK™ test was established at 18.19 ng/mL (0.23 ng/test).

Stop Solution (7 mL) – 0.6 N sulfuric acid. CAUTION: Avoid contact with skin or eyes; flush with water immediately if contact occurs.

Signal Word: Warning
H314: Causes severe skin burns and eye damage

Wash Buffer Concentrate (50 mL) – 20X concentrate containing phosphate buffered saline, detergent, and 0.2% thimerosal

H373: May cause damage to organs through prolonged or repeated exposure
Signal Word: Warning
H373: May cause damage to organs through prolonged or repeated exposure

SUBSTANCES (14 mL) – solution containing tetramethylbenzidine and peroxide

ASSOCIATED MATERIALS AND EQUIPMENT REQUIRED BUT NOT PROVIDED

SQUIRT BOTTLE FOR WASH REAGENT

WASH SOLUTION LABEL

100 DISPOSABLE PLASTIC TRANSFER PIPETTES

2 PLASTIC ADHESIVE SHEETS

1 WASH SOLUTION LABEL

50 WOODEN APPLICATOR STICKS

MATERIALS AND EQUIPMENT REQUIRED BUT NOT PROVIDED

SQUIRT BOTTLE FOR WASH REAGENT

VORTEX MIXER

DISPOSABLE GLOVES

950mL DISTILLED WATER FOR DILUTING WASH REAGENT

ELISA PLATE READER CAPABLE OF READING AT 450 NM, 450/620 NM, OR 450/630 NM

SHELF LIFE AND STORAGE

The shelf life expiration date of this kit is given on the box label. Expiration dates for each component are listed on the individual labels. The kit should be stored between 2°C and 8°C and should be returned to the refrigerator as soon as possible after use.

PRECAUTIONS

1. Rx Only – Prescription Only
2. Each component in the kit should be inspected for any signs of leakage. Upon arrival, the kit should be inspected to ensure that components are not frozen or warm to the touch due to improper shipping conditions.
3. Reagents from different kits should not be mixed. Do not use a kit past the assigned expiration date.
4. Bring all components to room temperature before use to ensure proper kit reactivity. Remove the reagents from the foam insert to reduce the time needed to warm to room temperature.
5. Do not freeze the reagents. The kit should be stored between 2°C and 8°C.
6. Caps and tips are color-coded; do NOT mix or interchange!
7. When handling assay wells, avoid scratching the bottom of the wells because this may result in elevated absorbance readings.
8. Unused microwells must be placed back inside of the resealable pouch with the desiccant to protect them from moisture.
9. Hold reagent bottles vertically when dispensing to ensure proper drop size and correct volume.
10. Microbial contamination of reagents may decrease the accuracy of the assay. Avoid microbial contamination of reagents by using sterile disposable pipettes if removing aliquots from reagent bottles.
11. All reagents, with the exception of the Wash Buffer Concentrate, are supplied in ready-to-use bottles. Reagents can be dispensed directly from the dropper bottles or decanted for use with multichannel pipettes. If excess reagent has been decanted, the excess should be discarded. Do not pour back into the bottle. The Substrate should be stored in and used from the light-protected bottle in which it is supplied. If an aliquot is removed from the original bottle for any reason, do not return unused Substrate to the original bottle. The Substrate is light sensitive and should be protected from direct sunlight or UV sources.
12. Perform the washing procedure as directed to avoid high background reactions.
13. The test has been optimized for sensitivity and specificity. Do not deviate from the specified procedure. Alterations of the specified procedure and/or test conditions may affect the sensitivity and specificity of the test.
14. Fecal specimens may contain potentially infectious agents and should be handled at “Biosafety Level 2” as recommended in the CDC/NIH Manual, “Biosafety in Microbiological and Biomedical Laboratories.”
15. Handle specimens and used microassay wells as if capable of transmitting infectious agents. Wear disposable gloves when doing the test.
16. Reagents contain 0.05% ProClin® 300 as a preservative. Although the concentration is low, ProClin® 300 is known to be harmful. If skin irritation or rash occurs, get medical advice/attention. Take off contaminated clothing and wash it before reuse. Handle reagents according to existing regulations for laboratory safety and good laboratory practice. Safety Data Sheets for this product are available upon request, contact technical support.
17. The 20X Wash Buffer Concentrate contains 0.2% Thimerosal as a preservative. Once diluted to normal use concentration this solution is classified as non-hazardous. The Stop Solution contains 0.6N sulfuric acid. Flush with water immediately if contact occurs. Take off contaminated clothing and wash it before reuse. Handle reagents according to existing regulations for laboratory safety and good laboratory practice. Safety Data Sheets for this product are available upon request, contact technical support.
18. Follow your national, regional, and local ordinances accordingly for waste disposal regulations. Do not place in trash, dispose of as hazardous waste.

PRELIMINARY PREPARATIONS
1. All reagents must be at room temperature prior to use in the assay.
2. Prepare 1X Wash Solution. The Wash Buffer Concentrate is supplied as a 20X concentrate (a precipitate may be noticed). It should be diluted to a total volume of 1 liter by adding 50 mL of the concentrate to 950 mL of distilled water. The 1X Wash Solution can be stored between 2° and 8°C for up to the expiration date of the kit.
3. Assay Strip Preparation. Each strip contains 8 wells coated with antibodies specific to H. pylori antigen. Each specimen or control will use one of these coated wells. Determine the number of wells to be used. Avoid contact with the base of the wells. Assay wells not used must be returned to the foil pouch and carefully resealed with desiccant.

Retrospective Sample Study
A supplemental retrospective sample study was performed comparing the H. PYLORI CHEK™ test to an FDA cleared commercial ELISA. For this study, 196 samples (75 positive and 121 negative by the commercial ELISA) were evaluated. There was 100% correlation of results between the assays.

REPRODUCIBILITY
The reproducibility of the H. PYLORI CHEK™ test was determined using 8 fecal specimens that were coded to prevent identification during testing. Testing was performed at 2 independent laboratories and on-site at TECHLAB, Inc. The samples were tested in triplicate twice a day over a 5-day period by multiple technicians at each site using 2 different kit lots. The results were consistent among the different locations, and exhibited a correlation of 97.5%.

CROSS REACTIVITY
The H. PYLORI CHEK™ test was evaluated for cross-reactivity with common intestinal organisms and viruses listed below. None of the organisms or viruses were shown to interfere with the performance of the H. PYLORI QUIK CHEK™ test.

Acinetobacter baumannii Escherichia coli EPEC
Bacillus cereus Escherichia coli ETEx
Bacillus subtilis Escherichia coli O157:H7 (non-toxigenic)
Borrelia burgdorferi Escherichia coli O157:H7 (toxigenic)
Campylobacter coli Haemophilus influenzae
Campylobacter fetus Lactobacillus acidophilus
Campylobacter helveticus Listeria monocytogenes
Campylobacter hyointestinalis Peptostreptococcus anaerobius
Campylobacter jejuni Porphyromonas asaccharolytica
Campylobacter lari Prevotella melaninogenica
Campylobacter upsaliensis Proteus vulgaris
Candida albicans Pseudomonas aeruginosa
Clostridium bifermentans Salmonella typhimurium
Clostridium difficile Staphylococcus aureus
Clostridium difficile Prevotella melaninogenica
Clostridium perfringens Staphylococcus aureus (Cowan’s)
Escherichia coli Streptococcus agalactiae
Escherichia coli Yersinia enterocolitica

Cross reacted organisms and viruses:
- Acinetobacter baumannii
- Bacillus cereus
- Borrelia burgdorferi
- Campylobacter coli
- Campylobacter fetus
- Campylobacter helveticus
- Campylobacter jejuni
- Campylobacter lari
- Campylobacter upsaliensis

- Proteus vulgaris
- Salmonella typhimurium
- Staphylococcus aureus
- Streptococcus agalactiae
- Yersinia enterocolitica
to factors such as the increased prevalence of antibiotic resistant \textit{H. pylori} strains. The effectiveness of eradication therapy can improve significantly when a tailored regimen is prescribed.

**PERFORMANCE CHARACTERISTICS**

The performance of the \textit{H. PYLORI CHEK}™ test was evaluated at 6 independent sites. Patients were recruited that were undergoing endoscopy as part of routine care. A composite reference method (CRM) comparison was used in the evaluation consisting of rapid urease and histology of the biopsy samples. The following table shows a summary of the clinical performance data. The results of the study show that the \textit{H. PYLORI CHEK}™ test, by dual wavelength spectrophotometric analysis, exhibited sensitivity of 100\% and specificity of 96.1\% with CRM biopsy results. Testing was also conducted by visual reading of plates. Visual results were the same as dual wavelength spectrophotometric results 99\% of the time.

**Age and Gender Distribution**

Age and gender information was available for 109 patients. The ages ranged from 19 to 82 years. Of the 109 patients tested, 66\% were female and 34\% were male. No difference in test performance was observed based on patient age or gender.

1. Use standard in-house collection and handling procedures for fecal specimens. Collect fecal specimens in clean, leak-proof containers.
2. Fecal specimens that are stored frozen may be thawed up to 2 times. If using frozen specimens, thaw at room temperature.
3. Set up and label one test tube for each sample as necessary.
4. Add 200 µL \textit{Diluent} to each tube for unpreserved specimens. For specimens in Cary Blair or C&S Transport media, add 100 µL \textit{Diluent} to each tube.
5. Obtain one disposable plastic transfer pipette (supplied with the kit) for each sample.
6. Mix all specimens thoroughly regardless of consistency - it is essential that the samples be evenly suspended before sampling.
   • For fresh or frozen/thawed specimens, using the disposable plastic transfer pipette, add 50 µL (first graduation mark) of fecal specimen to the tube containing \textit{Diluent} and mix well. If the specimen cannot be pipetted, use an applicator stick to transfer approximately 0.05 g of feces. This is about the size of a small pea (about 3mm in diameter).
   • For specimens in Cary Blair or C&S Transport media, add 100 µL (second graduation mark) of fecal specimen to the tube containing \textit{Diluent} and mix well.
7. Close each tube of diluted sample and mix thoroughly. Proper mixing can be achieved by vortexing or inverting the tube several times. Do not allow the sample to remain in the \textit{Diluent} for >2 hours.
8. If using semi-automated or automated washing equipment, once diluted, specimens must be centrifuged (5000 x g for 10 minutes) to remove any particulate matter from the supernatant before transfer to assay wells.

**TEST PROCEDURE**

1. Bring all reagents and the required number of test strips to room temperature before use.
2. Add 1 drop (50 μL) of Conjugate (red cap) to each well. Gently mix the Conjugate in the bottle by inverting several times. Be sure to hold each bottle vertically when adding the drops. Use 1 well for each fecal specimen, 1 well for the Positive Control and 1 well for the negative control. Identification marks may be written directly on side of well.

3. Using a new transfer pipette, transfer 100 μL of diluted specimen (or supernatant from the centrifuged diluted sample if using automated washing equipment) to the assay well. Add 1 drop (50 μL) of the Positive Control (black cap) to the positive control well and 100 μL of the Diluent (negative control) to the negative control well. Tap the sides of the plate to mix.

4. Cut the adhesive plastic sheet to the size necessary to cover the wells. Cover the wells and incubate them at 37°C ± 2°C for 50 minutes.

5. Shake out contents of assay wells into a discard pan.

6. Wash each well using the 1X Wash Solution in a squirt bottle with a fine-tipped nozzle, directing the Wash Solution to the bottom of the well with force. Fill the wells, and then shake the Wash Solution out of the well into a discard pan. Slap the inverted plate on a dry paper towel.

Note: If using semi-automated or automated washing equipment, add 350 μL of 1X Wash Solution to each well. Wash for a total of 5 times.

7. Repeat step 6 four additional times using a dry paper towel each time. If any particulate matter is seen in the wells, continue washing until all the particulate matter is removed.

8. After washing, completely remove any residual liquid in the wells by striking the plate onto a dry paper towel until no liquid comes out. Dispose of paper towels and specimen containers properly.

9. Add 2 drops (100 μL) of Substrate (blue cap) to each well. Gently tap the wells to mix the Substrate. Incubate the wells at room temperature for 10 minutes. Gently tap the wells at 5 minutes.

10. Add 1 drop (50 μL) of Stop Solution (yellow cap) to each well. Gently tap the wells and wait 2 minutes before reading. The addition of the Stop Solution converts the blue color to a yellow color which may be quantitated by measuring the optical density at 450 nm on a microplate ELISA reader. The instrument should be blanked against air. If a dual wavelength reader is used, blank against air at 620 or 630 and read at 450 nm. Wipe the underside of each well before measuring the optical density. If an ELISA reader is unavailable, the test may be read visually in good light against a white background. Read within ten minutes after adding Stop Solution.

QUALITY CONTROL

1. Positive and negative controls must be run with each series of test specimens. The positive control demonstrates that the assay is functioning properly for the detection of H. pylori antigen in fecal specimens. The negative control demonstrates that the assay is not reacting nonspecifically.

   a) **Positive Control must be a visible yellow color.** If read on a spectrophotometer, the OD at 450 nm or using dual wavelength at 450/620 nm or 450/630 nm must be ≥ 0.500. Any well that gives a positive reading without visible color should be repositioned, wiped on the underside of the well, and read again.

   b) **Negative Control must be visually clear.** If read on a spectrophotometer, the OD at 450 nm must be <0.120. If read at 450/620 nm or 450/630 nm the absorbance must be < 0.080. If not, the test is invalid and should be repeated, paying attention to the wash procedure.

2. Visual readings must be taken in good light against a white background.

</tbody>
</table>

A positive result in the **H. PYLORI CHEK™** test confirms the presence of H. pylori antigen in the sample; a negative result indicates the absence of antigen or insufficient levels of antigen for detection.

**Visual Interpretation**
The negative control well should be colorless or have only a faint yellow color. The Positive Control well should give a visible yellow color. If these results are not observed, call Technical Services. A test sample is considered positive if it has an obvious yellow color when compared to the negative control well. It may be less yellow or more yellow than the color observed in the positive control well. A test sample is considered negative if the reaction is colorless or less yellow than the negative control well.

**LIMITATIONS OF THE H. PYLORI CHEK™ TEST**

1. The **H. PYLORI CHEK™** test is used to detect H. pylori antigen in fecal specimens. The test confirms the presence of H. pylori antigen in the sample, and this information should be taken under consideration by the physician in light of the clinical history and physical examination of the patient.

2. A negative test result does not preclude the possibility of the presence of H. pylori antigen in the specimen which may occur if the level of antigen is below the detection limit of the test.

3. False negative results may occur if a patient has used antibiotics, proton pump inhibitors (PPIs) or bismuth compounds in the 14 days prior to fecal sample collection, as these medications are known to inhibit H. pylori. In these cases, a new fecal sample should be collected and tested 14 days after treatment has stopped. Positive results from patients that have used antibiotics, PPIs, or bismuth compounds in the 14 days prior to fecal sample collection are still considered accurate.

4. Transferring too little sample, or failure to mix and completely suspend the sample in the Diluent, may result in a false-negative test result.

5. The **H. PYLORI CHEK™** test is qualitative. The intensity of the color should not be interpreted quantitatively.

6. No data exists on the effects of colonial washes, barium enemas, laxatives, or bowel preparations on the performance of the **H. PYLORI CHEK™** test. These procedures can result in extensive dilution or the presence of additives that may affect test performance.

7. Performance characteristics have not been established in asymptomatic populations.

### EXPECTED VALUES

The **H. PYLORI CHEK™** test detects the presence of Helicobacter pylori antigen in human fecal samples. H. pylori infection is a global phenomenon with reported prevalence rates in adults ranging from 20% to 95%. In addition to geographical location, factors such as age, ethnicity, and socioeconomic status also affect the prevalence rate. **H. pylori** is purportedly the cause of 70%-85% of gastric ulcers and 90%-95% of duodenal ulcers. Historically, treatment regimens to eradicate **H. pylori** infection reported success rates ranging from 76%-94%, but the efficacy of standard treatment regimens has declined due
2. Add 1 drop (50 μL) of Conjugate (red cap) to each well. Gently mix the Conjugate in the bottle by inverting several times. Be sure to hold each bottle vertically when adding the drops. Use 1 well for each fecal specimen, 1 well for the Positive Control and 1 well for the negative control. Identification marks may be written directly on side of well.
3. Using a new transfer pipette, transfer 100 μL of diluted specimen (or supernatant from the centrifuged diluted sample if using automated washing equipment) to the assay well. Add 1 drop (50 μL) of the Positive Control (black cap) to the positive control well and 100 μL of the Diluent (negative control) to the negative control well. Tap the sides of the plate to mix.
4. Cut the adhesive plastic sheet to the size necessary to cover the wells. Cover the wells and incubate them at 37°C ± 2°C for 50 minutes.
5. Shake out contents of assay wells into a discard pan.

6. Wash each well using the 1X Wash Solution in a squirt bottle with a fine-tipped nozzle, directing the Wash Solution to the bottom of the well with force. Fill the wells, and then shake the Wash Solution out of the well into a discard pan. Slap the inverted plate on a dry paper towel.

   Note: If using semi-automated or automated washing equipment, add 350 μL of 1X Wash Solution to each well. Wash for a total of 5 times.
7. Repeat step 6 four additional times using a dry paper towel each time. If any particulate matter is seen in the wells, continue washing until all the particulate matter is removed.
8. After washing, completely remove any residual liquid in the wells by striking the plate onto a dry paper towel until no liquid comes out. Dispose of paper towels and specimen containers properly.
9. Add 2 drops (100 μL) of Substrate (blue cap) to each well. Gently tap the wells to mix the Substrate. Incubate the wells at room temperature for 10 minutes. Gently tap the wells at 5 minutes.
10. Add 1 drop (50 μL) of Stop Solution (yellow cap) to each well. Gently tap the wells and wait 2 minutes before reading. The addition of the Stop Solution converts the blue color to a yellow color which may be quantitated by measuring the optical density at 450 nm on a microplate ELISA reader. The instrument should be blanked against air. If a dual wavelength reader is used, blank against air at 620 or 630 and read at 450 nm. Wipe the underside of each well before measuring the optical density. If an ELISA reader is unavailable, the test may be read visually in good light against a white background. Read within ten minutes after adding Stop Solution.

QUALITY CONTROL
1. Positive and negative controls must be run with each series of test specimens. The positive control demonstrates that the assay is functioning properly for the detection of H. pylori antigen in fecal specimens. The negative control demonstrates that the assay is not reacting nonspecifically.
   a) Positive Control must be a visible yellow color. If read on a spectrophotometer, the OD at 450 nm or using dual wavelength at 450/620 nm or 450/630 nm must be ≥ 0.500. Any well that gives a positive reading without visible color should be repositioned, wiped on the underside of the well, and read again.
   b) Negative Control must be visually clear. If read on a spectrophotometer, the OD at 450 nm must be <0.120. If read at 450/620 nm or 450/630 nm the absorbance must be < 0.080. If not, the test is invalid and should be repeated, paying attention to the wash procedure.
2. Visual readings must be taken in good light against a white background.

INTERPRETATION OF RESULTS

A positive result in the H. PYLORI CHEK™ test confirms the presence of H. pylori antigen in the sample; a negative result indicates the absence of antigen or insufficient levels of antigen for detection.

Visual Interpretation
The negative control well should be colorless or have only a faint yellow color. The Positive Control well should give a visible yellow color. If these results are not observed, call Technical Services. A test sample is considered positive if it has an obvious yellow color when compared to the negative control well. It may be less yellow or more yellow than the color observed in the positive control well. A test sample is considered negative if the reaction is colorless or less yellow than the negative control well.

LIMITATIONS OF THE H. PYLORI CHEK™ TEST
1. The H. PYLORI CHEK™ test is used to detect H. pylori antigen in fecal specimens. The test confirms the presence of H. pylori antigen in the sample, and this information should be taken under consideration by the physician in light of the clinical history and physical examination of the patient.
2. A negative test result does not preclude the possibility of the presence of H. pylori antigen in the specimen which may occur if the level of antigen is below the detection limit of the test.
3. False negative results may occur if a patient has used antibiotics, proton pump inhibitors (PPIs) or bismuth compounds in the 14 days prior to fecal sample collection, as these medications are known to inhibit H. pylori. In these cases, a new fecal sample should be collected and tested 14 days after treatment has stopped. Positive results from patients that have used antibiotics, PPIs, or bismuth compounds in the 14 days prior to fecal sample collection are still considered accurate.
4. Transferring too little sample, or failure to mix and completely suspend the sample in the Diluent may result in a false-negative test result.
5. The H. PYLORI CHEK™ test is qualitative. The intensity of the color should not be interpreted quantitatively.
6. No data exists on the effects of colonic washes, barium enemas, laxatives, or bowel preparations on the performance of the H. PYLORI CHEK™ test. These procedures can result in extensive dilution or the presence of additives that may affect test performance.
7. Performance characteristics have not been established in asymptomatic populations.

EXPECTED VALUES
The H. PYLORI CHEK™ test detects the presence of Helicobacter pylori antigen in human fecal samples. H. pylori infection is a global phenomenon with reported prevalence rates in adults ranging from 20% to 95%. In addition to geographical location, factors such as age, ethnicity, and socioeconomic status also affect the prevalence rate. H. pylori is purportedly the cause of 70%-85% of gastric ulcers and 90%-95% of duodenal ulcers. Historically, treatment regimens to eradicate H. pylori infection reported success rates ranging from 76%-94%, but the efficacy of standard treatment regimens has declined due
to factors such as the increased prevalence of antibiotic resistant *H. pylori* strains. The effectiveness of eradication therapy can improve significantly when a tailored regimen is prescribed.

**PERFORMANCE CHARACTERISTICS**

The performance of the *H. PYLORI CHEK™* test was evaluated at 6 independent sites. Patients were recruited that were undergoing endoscopy as part of routine care. A composite reference method (CRM) comparison was used in the evaluation consisting of rapid urease and histology of the biopsy samples. The following table shows a summary of the clinical performance data. The results of the study show that the *H. PYLORI CHEK™* test, by dual wavelength spectrophotometric analysis, exhibited sensitivity of 100% and specificity of 96.1% with CRM biopsy results. Testing was also conducted by visual reading of plates. Visual results were the same as dual wavelength spectrophotometric results 99% of the time.

**Age and Gender Distribution**

Age and gender information was available for 109 patients. The ages ranged from 19 to 82 years. Of the 109 patients tested, 66% were female and 34% were male. No difference in test performance was observed based on patient age or gender.

<td>Fecal Specimens in Formalin-based fixative (e.g., sodium acetate formalin, 10% formalin)</td>
</tr>
<tr>
<td>Frozen Fecal Specimens</td>
<td>Fecal Specimens in alcohol-based fixative (e.g., polyvinyl alcohol)</td>
</tr>
<tr>
<td>Specimens in Transport Media (Cary Blair, C&amp;S)</td>
<td>Concentrated Fecal Specimens</td>
</tr>
</tbody>
</table>

**Storage Condition**

- **Recommended Storage Time**
  - Fresh Unpreserved Samples and Samples in Cary Blair or C&S Transport Media Stored between 2°C and 8°C: 96 hours
  - Fresh Unpreserved Samples and Samples in Cary Blair or C&S Transport Media Stored between 20°C and 25°C: 96 hours
  - Frozen Unpreserved Samples Stored at ≤ -10°C: 14 days

1. Use standard in-house collection and handling procedures for fecal specimens. Collect fecal specimens in clean, leak-proof containers.
2. Fecal specimens that are stored frozen may be thawed up to 2 times. If using frozen specimens, thaw at room temperature.
3. Set up and label one test tube for each sample as necessary.
4. Add 200 µL Diluent to each tube for unpreserved specimens. For specimens in Cary Blair or C&S Transport media, add 100 µL Diluent to each tube.
5. Obtain one disposable plastic transfer pipette (supplied with the kit) for each sample.

**Transfer Pipette**

- 300 µL
- 200 µL
- 100 µL
- 50 µL

6. Mix all specimens thoroughly regardless of consistency - it is essential that the samples be evenly suspended before sampling.
   - For fresh or frozen/thawed specimens, using the disposable plastic transfer pipette, add 50 µL (first graduation mark) of fecal specimen to the tube containing Diluent and mix well. If the specimen cannot be pipetted, use an applicator stick to transfer approximately 0.05 g of feces. This is about the size of a small pea (about 3mm in diameter).
   - For specimens in Cary Blair or C&S Transport media, add 100 µL (second graduation mark) of fecal specimen to the tube containing Diluent and mix well.

7. Close each tube of diluted sample and mix thoroughly. Proper mixing can be achieved by vortexing or inverting the tube several times. Do not allow the sample to remain in the Diluent for >2 hours.
8. If using semi-automated or automated washing equipment, once diluted, specimens must be centrifuged (5000 x g for 10 minutes) to remove any particulate matter from the supernatant before transfer to assay wells.

**TEST PROCEDURE**

1. Bring all reagents and the required number of test strips to room temperature before use.
8. Unused microwells must be placed back inside of the resealable pouch with the desiccant to protect them from moisture.
9. Hold reagent bottles vertically when dispensing to ensure proper drop size and correct volume.
10. Microbial contamination of reagents may decrease the accuracy of the assay. Avoid microbial contamination of reagents by using sterile disposable pipettes if removing aliquots from reagent bottles.
11. All reagents, with the exception of the Wash Buffer Concentrate, are supplied in ready-to-use bottles. Reagents can be dispensed directly from the dropper bottles or decanted for use with multichannel pipettes. If excess reagent has been decanted, the excess should be discarded. Do not pour back into the bottle. The Substrate should be stored in and used from the light-protected bottle in which it is supplied. If an aliquot is removed from the original bottle for any reason, do not return unused Substrate to the original bottle. The Substrate is light sensitive and should be protected from direct sunlight or UV sources.
12. Perform the washing procedure as directed to avoid high background reactions.
13. The test has been optimized for sensitivity and specificity. Do not deviate from the specified procedure. Alterations of the specified procedure and/or test conditions may affect the sensitivity and specificity of the test.
14. Fecal specimens may contain potentially infectious agents and should be handled at “Biosafety Level 2” as recommended in the CDC/NIH Manual, “Biosafety in Microbiological and Biomedical Laboratories.”
15. Handle specimens and used microassay wells as if capable of transmitting infectious agents. Wear disposable gloves when doing the test.
16. Reagents contain 0.05% ProClin® 300 as a preservative. Although the concentration is low, ProClin® 300 is known to be harmful. If skin irritation or rash occurs, get medical advice/attention. Take off contaminated clothing and wash it before reuse. Handle reagents according to existing regulations for laboratory safety and good laboratory practice. Safety Data Sheets for this product are available upon request, contact technical support.
17. The 20X Wash Buffer Concentrate contains 0.2% Thimerosal as a preservative. Once diluted to normal use concentration this solution is classified as non-hazardous. The Stop Solution contains 0.6N sulfuric acid. Flush with water immediately if contact occurs. Take off contaminated clothing and wash it before reuse. Handle reagents according to existing regulations for laboratory safety and good laboratory practice. Safety Data Sheets for this product are available upon request, contact technical support.
18. Follow your national, regional, and local ordinances accordingly for waste disposal regulations. Do not place in trash, dispose of as hazardous waste.

PRELIMINARY PREPARATIONS
1. All reagents must be at room temperature prior to use in the assay.
2. Prepare 1X Wash Solution. The Wash Buffer Concentrate is supplied as a 20X concentrate (a precipitate may be noticed). It should be diluted to a total volume of 1 liter by adding 50 mL of the concentrate to 950 mL of distilled water. The 1X Wash Solution can be stored between 2° and 8°C for up to the expiration date of the kit.
3. Assay Strip Preparation. Each strip contains 8 wells coated with antibodies specific to H. pylori antigen. Each specimen or control will use one of these coated wells. Determine the number of wells to be used. Avoid contact with the base of the wells. Assay wells not used must be returned to the foil pouch and carefully resealed with desiccant.

Retrospective Sample Study
A supplemental retrospective sample study was performed comparing the H. PYLORI CHEK™ test to an FDA cleared commercial ELISA. For this study, 196 samples (75 positive and 121 negative by the commercial ELISA) were evaluated. There was 100% correlation of results between the assays.

REPRODUCIBILITY
The reproducibility of the H. PYLORI CHEK™ test was determined using 8 fecal specimens that were coded to prevent identification during testing. Testing was performed at 2 independent laboratories and on-site at TECHLAB, Inc. The samples were tested in triplicate twice a day over a 5-day period by multiple technicians at each site using 2 different kit lots. The results were consistent among the different locations, and exhibited a correlation of 97.5%.

CROSS REACTIVITY
The H. PYLORI CHEK™ test was evaluated for cross-reactivity with common intestinal organisms and viruses listed below. None of the organisms or viruses were shown to interfere with the performance of the H. PYLORI CHEK™ test.

Human Coronavirus  
Coxsackievirus B1, B2, B3, B6  

**INCLUSIVITY STUDY**

The following strains, which include isolates representing described *H. pylori* populations, were tested for reactivity with the *H. PYLORI CHEK™* test. All strains tested generated a positive result.

| ATCC 700392 | JP26  
| ATCC 43526  | ATCC 43504  
| ATCC 700824  | ATCC 43579  

**INTERFERING SUBSTANCES (U.S. FORMULATION)**

The following substances had no effect on positive or negative *H. PYLORI QUIK CHEK™* test results analyzed at the concentrations indicated:

- Barium sulfate (5% w/v), Benzalkonium Chloride (1% w/v), Ciprofloxacin (0.25% w/v), Ethanol (1% w/v), Hog gastric mucin (3.5% w/v), Human blood (40% v/v), Hydrocortisone (1% w/v), Imodium® (5% v/v), Kapectate® (5% v/v), Leukocytes (0.05% v/v), Maalox® Advanced (5% v/v), Mesalazine (10% w/v), Metronidazole (0.25% w/v), MiraLax® (7% w/v), Mineral Oil (10% w/v), Mylanta® (4.2 mg/mL), Naproxen Sodium (5% w/v), Nonoxynol-9 (1% w/v), Nystatin (1% w/v), Palmitic Acid/Fecal Fat (40% w/v), Pepto-Bismol® (5% v/v), Phenylephrine (1% w/v), Prilosec OTC® (6 µg/mL), Sennosides (1% w/v), Simethicone (10% w/v), Stearic Acid/Fecal Fat (40% w/v), Tagamet® (5 µg/mL), TUMS® (50 µg/mL), 
- Human Urine (5% v/v), and Vancomycin (0.25% v/v).

**ANALYTICAL SENSITIVITY**

The Limit of Detection (LoD) for the *H. PYLORI CHEK™* test was established at 6.70 ng/mL in fecal matrix (0.13 ng/test) for *Helicobacter pylori* antigen using cell lysate antigen prepared from *H. pylori* strain ATCC 43526. For specimens in Cary Blair media, the LoD was established at 26.57 ng/mL (0.33 ng/test). For specimens in C&S media, the LoD was established at 18.19 ng/mL (0.23 ng/test).

**PRECISION – INTRA-ASSAY**

For the determination of intra-assay performance, 8 fecal samples were analyzed by the *H. PYLORI CHEK™* test. The samples included 2 negative, 2 high negative, 2 low positive, and 2 moderate positive samples. Each specimen was assayed a total of five times using two different kit lots. Positive specimens tested as expected and negative specimens consistently tested negative.

**PRECISION – INTER-ASSAY**

For the determination of inter-assay performance, 8 fecal samples were analyzed by the *H. PYLORI CHEK™* test. The samples included 2 negative, 2 high negative, 2 low positive, and 2 moderate positive samples. The samples were tested twice a day by multiple technicians over a 12-day period using 2 different kit lots. The positive samples tested as expected 98.3% of the time and the negatives tested as expected 97.8% of the time.

**FRESH VERSUS FROZEN SAMPLES**

The effect of long term frozen specimen storage on antigen stability was evaluated. For the analysis, a total of 32 fecal specimens was tested with the *H. PYLORI CHEK™* test. The fecal specimens consisted of 2 negative fecal samples, 5 high negative fecal samples, 10 low positive fecal samples, and 15 positive fecal samples covering the range of the test (50 ng/mL – 1200 ng/mL). Samples were prepared and stored ≤ -10°C and ≤ -70°C and tested at 0, 5, 10, and 14 days. No conversion of positive-to-negative or negative-to-positive was observed in any of the samples at the specified time points.

**ACCESSORIES**

- 100 Disposable plastic transfer pipettes  
- 2 Plastic adhesive sheets  
- 1 Wash Solution Label  
- 50 Wooden Applicator sticks  

**MATERIALS AND EQUIPMENT REQUIRED BUT NOT PROVIDED**

- Squirt bottle for wash reagent  
- Vortex mixer  
- Timer  
- Discard container  
- Absorbent paper  
- Disposable gloves  
- 950 mL distilled water for diluting wash reagent  
- ELISA plate reader capable of reading at 450 nm, 450/620 nm, or 450/330 nm  
- Small tubes for dilution of fecal specimens (e.g., plastic 2 mL conical microcentrifuge tubes)

**SHELF LIFE AND STORAGE**

The life expiration date of this kit is given on the box label. Expiration dates for each component are listed on the individual labels. The kit should be stored between 2°C and 8°C and should be returned to the refrigerator as soon as possible after use.

**PRECAUTIONS**

1. Rx Only – Prescription Only  
2. Each component in the kit should be inspected for any signs of leakage. Upon arrival, the kit should be inspected to ensure that components are not frozen or warm to the touch due to improper shipping conditions.  
3. Reagents from different kits should not be mixed. Do not use a kit past the assigned expiration date.  
4. Bring all components to room temperature before use to ensure proper kit reactivity. Remove the reagents from the foam insert to reduce the time needed to warm to room temperature.  
5. Do not freeze the reagents. The kit should be stored between 2°C and 8°C.  
6. Caps and tips are color-coded; do NOT mix or interchange!  
7. When handling assay wells, avoid scratching the bottom of the wells because this may result in elevated absorbance readings.
H. PYLORI CHEK™

INTENDED USE

The TECHLAB® H. PYLORI CHEK™ test is an enzyme immunoassay for the qualitative detection of Helicobacter pylori specific antigen. It is intended for use with human fecal specimens to aid in the diagnosis of H. pylori infection and to demonstrate loss of H. pylori antigen following treatment. The test can be used with unpreserved fecal specimens and fecal specimens preserved in transport media from patients suspected of H. pylori infection. Testing of patients to demonstrate loss of H. pylori antigen following treatment should be performed no sooner than 4 weeks after completion of the treatment regimen. Test results should be taken into consideration by the physician in conjunction with the patient history and symptoms.

Caution: U.S. Federal Law restricts this device to sale by or on the order of a physician.

EXPLANATION

It is estimated that half of the global population is infected with H. pylori.1 The majority of those infected remain asymptomatic and do not require treatment (colonized individuals). A minority of infected individuals develop gastritis, and a fraction of those further develop gastric ulcers or gastric cancer.2 The diagnosis of H. pylori infection is endoscopy with biopsy – the biopsied tissue is tested for the presence of H. pylori by culture, histology, or rapid urease test. Under current guidelines, endoscopy is still recommended for the diagnosis of H. pylori infection in patients with alarm symptoms (e.g. GI bleeding, sudden weight loss, excessive vomiting, anemia), or patients over the age of 55. However, for younger patients not exhibiting alarm symptoms, non-invasive tests such as the urea breath test (UBT) or fecal antigen test are recommended for diagnosis of H. pylori infection.3,4 Following completion of a treatment regimen of antibiotics and a proton pump inhibitor (PPI), it is recommended that patients be tested to verify eradication of H. pylori infection.5 Serum antibody tests are also available, but these are unable to distinguish between past and current infection. By detecting antigen present in fecal specimens, the H. PYLORI CHEK™ test allows for the non-invasive detection of H. pylori when endoscopy is not required.

PRINCIPLE OF THE TEST

The H. P YLORI CHEK™ test uses antibodies specific to H. pylori antigen. The Microassay Plate in the kit contains immobilized capture antibodies against H. pylori antigen. The Conjugate consists of antibodies specific to H. pylori antigen conjugated to horseradish peroxidase. In the assay, an aliquot of a diluted fecal specimen is transferred to a microassay well containing the Conjugate. If the antigen is present in the specimen, it will bind to the Conjugate and to the immobilized capture antibody during the incubation phase. Any unbound material is removed during the washing steps. Following the addition of Substrate, a color is detected due to the enzyme-antibody-antigen complexes that formed in the presence of antigen.

MATERIALS PROVIDED

Microassay Plate – 12 strips, each consisting of 8 wells coated with antibodies to H. pylori antigen (stored with desiccant).

Conjugate (7 mL) – Antibodies to H. pylori antigen coupled to horseradish peroxidase in a buffered protein solution containing 0.05% ProClin® 300

Signal Word: Warning – 0.05% ProClin® 300

H317: May cause an allergic skin reaction
P261, P272, P280, P302, P352, P333, P313, P321, P362, P364, P501

Diluent (40 mL) – Buffered protein solution. The Diluent is also to be used as the negative control solution (see TEST PROCEDURE) containing 0.05% ProClin® 300.

PROZONE

To ensure that a high concentration of H. pylori antigen does not interfere with a positive reaction in the H. PYLORI CHEK™ test, high positive samples were prepared by spiking a negative fecal pool at concentrations up to 10 times the highest concentration of antigen observed in a positive clinical specimen. A total of 5 different dilutions of H. pylori antigen was prepared and tested in triplicate. The results demonstrated that there was no overall prozone effect, that elevated levels of antigen did not affect the detection of the antigen.
